Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full

                                          This sequence is the human glycosyl sulfotransferase-3 (GST-3) of the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocytes to secondary lymph organs
                                                                                                                                                                                                                                                                                                                                                             20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ThrPheLysGlnSerThrAlaTrpMetLeuHisMetAlaValArgAspLeuIleArgAla 100
length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length muman cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                                                                                          40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
            directs expression of a MECA-79 antigen. This can be done by directs expression of a MECA-79 antigen. This can be done by directs expression of a MECA-79 antigen. This can be done by administering to the subject an oligoaccharide L-selectin antagonist that inhibits binding of L-selectin to a MECA-79 antigen, for example by administering antibody material that specifically binds betal, 3GT, antisense nucleic acid molecule. L-selectin.

and/or a betal, 3GT antisense nucleic acid molecule. L-selectin.

alternatively, the expression or activity of LSST-2 or its active fragment can be reduced in combination with reducing the expression or activity of betal, 3GT. The method is useful for treating L-selectin mediated conditions such as Crohn's disease and ulcerative colitis, inflammatory disorders of the skin such as allergic contact dermatitis, providensis and Lichen planus, lymphomas, chronic pneumonia, delayed-type hypersensitivity reactions, diabetes and hyperplastic thymus. The present sequence is that of human transferase TRNSFS-11, 1 of 15 claimed novel human transferase proteins of the invention (see AAY79209-31). The sequence was deduced from a cDNA clone (see AAZ94211) isolated from a gallbladder library. It shows homology to mouse Nearatologic and gastrointestinal tissues, especially those associated with inflammation and cell proliferation. The new human transferases and polynuclectides can be used in the diagnosis, prevention and treatment of cancer, developmental disorders, gastrointestinal disorders, genetic disorders, immunological disorders, neurological disorders preproductive disorders, and smooth muscle disorders. The polypeptides can also be used to raise antibodies, and to screen for agonists and antagonists of

364 247 304 ATGACCTTCAAGCAGAGCACCGCCTGGATGCTGCACATGGCTGTGCGGGATCTGATACGG 424 78 98 This sequence is the mouse glycosyl sulfotransferase-3 (GST-3) of the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocytes to secondary lymph organs 38 80 sulfotransferase; GST-3; detection; diagnosis; leukocyte homing; binding interaction; inflammation; lymphocyte homing; mouse; lymph organ. 20 Human and murine glycosyl sulfotransferase 3 and related polynucleotides. WPI; 2000-602362/57. N-PSDB; AAC76156. Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease.

Claim 11; Page 2599-2600; 5507pp; English.

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic, hepatotropic; vulnerary; sequences have activities such as: cytostatic, hepatotropic; vulnerary; antipartiant; limituparkinsonian; nootropic; neuroprotective; osteopathic; cardiant; thrombolythic; coaquiant; vasotropic; antipabetic; hypotensive; cardiant; thrombolythic; coaquiant; vasotropic; antipabeterial; properties antivity antibacterial; antivity antibacterial; antivity antibacterial; antivity antibacterial; antivity antibacterial; antivity antibacterial; antivity an be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, cardiovascular disease, disorders, osteoarthritis, graft vs host disease, cardiovascular disease, disorders, systemic lupus erythematosus, severe combined immunodeficiency (SCID) AIDS, viral, bacterial or fungal infection, malaria, autoimmune catiloge damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive

Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (MCD), and detecting associptibility to MCD. (I) is located to chromosome 1622, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy. The present sequence represents mouse intestinal N-acetylglucosamine-6-sulfotransferase, which is given in comparison with (I) in the exemplification of the

GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodesa, polyarteritis, dermatomyositis, systemic selectins, diabetes, glomerulomephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, darenalitis, hypoparathyroidism, pernicious anaemia, demnyelinating diseases, cirrhosis, ulcerative collifis, anaemia, demyelinating diseases, cirrhosis, ulcerative collifis, shadnome, infantile eczema, psoriasis lichen planue, allergic rhintis, brondial asthma, hypersensitivity, rheumatic fever and tissue rejection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents human corneal N-acetylglucosamine-6-sulforransferase (I), which is able to catalyse sulfation of keratan sulfate (KS). Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (MCD), and detecting susceptibility to MCD. (I) is located to chromosome 1692, and has substantial dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy

The invention relates to human drug metabolising enzymes referred as DME and nucleic acid molecules encoding such enzymes. Polynucleotides of the invention are useful incr assessing toxicity of test compounds and in gene therapy. Sequences of the invention are useful in the diagnosis, cheered therapy. Sequences of the invention are useful in the diagnosis, compounds and in gene therapy. Sequences of the invention are useful in the diagnosis, compounds and in gene prevention and treatment of autoimmune/inflammatory disorders such as addiagnosis, attention anaemia, anaemia, atherosclerosis, asthma, autoimmune deficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anaemia, atherosclerosis, asthma, autoimmune contentions of the content dermatitis, Crohn's disease, autoimmune contention of the content of the contention of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    244

The present sequence is mouse glycosyl sulfotransferase-4 (GST-4). GST-4

Gene is found on chromosome BEI. GST is a type 2 membrane protein useful

C for inhibiting a binding event between a selectin and a selectin ligand,

which comprises contacting the selectin with a non-sulphated selectin

Ilgand, GST and a small molecular agent that inhibits the sulphation

activity of GST. GST is also useful in inhibiting a selectin mediated

binding event. GST is useful in gene therapy to treat disorders such as

acute or chronic inflammation, systemic lupus erythematosus (SLE),

cheumatoid arthritis, polyarteritis nodosa, polymyositis,

dermatomyositis, systemic selerosis, diabetes, glomerilonephritis,

dermatomyositis, systemic selerosis, diabetes, glomerilonephritis,

disease, adrenalitis, hypoparathyroidism, perincious ansemia,

disease, adrenalitis, hypoparathyroidism, perincious ansemia,

myocarditis, regional enteritis, adult respiratory distress syndrome,

infantile eccema, psoriasis lichen planus, allergic rhinitis, bronchial

asthma, hypersensitivity, rheumatic fever and tissue rejection during New glycosyl sulfotransferases (GST)-4alpha, GST-4beta and GST-6 for diagnostic and therapeutic agent screening applications. myocarditis; adult respiratory distress syndrome; eczema; psoriasis; asthma; hypersensitivity; rheumatic fever; tissue rejection; chromosome 8E1. ŝ English Lee JK, Hemmerich 20-JUL-1999; 99US-0144694P. 19-JUL-2000; 2000WO-US019741 (REGC) UNIV CALIFORNIA. The present invention provides a method of modifying an acceptor molecule by contacting the acceptor with an isolated betal.3-Notacetylucosaminyltransferase (betal.3GnT) or an active fragment, where betal.3GnT directs expression of a MECA-79 antigen. The invention also provides a method of treating or preventing an L-selectin-mediated condition by reducing the expression or activity of a betal.3GnT that directs expression of a MECA-79 antigen. This can be done by administering to the subject an oligosaccharide L-selectin antagonist that inhibits binding of L-selectin to AMECA-79 antigen, for example by administering antibody material that specifically binds betal.3GnT, and/or a betal.3GnT antisense nucleic acid molecule. L-selectin

Sulfortransferase-2 (LSST-2) also directs MECA-79 antigen expression. Alternatively, the expression or activity of LSST-2 or its active fragment can be reduced in combination with reducing the expression or activity of betal.3GnT. The method is useful for treating L-selectin mediated conditions such as Crohn's disease and ulcerative colitis, inflammatory disorders of the skin such as allergic contact dermatitis, propersensitivity reactions, diabetes and hyperplastic thymus. This sequence represents mouse I-GINNAGST Mouse; betal, 3GnT; betal, 3-N-acetylglucosaminyltransferase; MECA-79; L-selectin; L-selectin sulforransferase-2; Crohn's disease; diabetes; ulcerative colitis; inflammatory skin disorder; psoriasis; Lichen planus; allergic contact dermatitis; lymphoma; chronic pneumonia; LSST-2; delayed-type hypersensitivity; reaction; hyperplastic thymus; antiulcer; antiinflammatory; antipsoriatic; antidiabetic; dermatological; antiallergic; intestinal-GlCNAc 6-sulfotransferase; I-GlCNAc6ST. acceptor molecule, comprises an isolated at directs expression of L-selectin se hamster ovary cells, or intestinal New enzyme, useful for modifying acceptor molecule, comp. L-selectin sulfotransferase-2 that directs expression of ligand antigen, MECA-79 in Chinese hamster ovary cells, GlcMx 6-sulfotransferase.

            nucleic acid encoding corneal N-acetylglucosamine-6-sulfotransferase,
                                                                                             The present invention describes human corneal N-acetylglucosamine-6-sulforransferase (I), which is able to catalyse sulfation of keratan sulfate (KG). Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (MCD), and detecting susceptibility to MCD. (I) is located to chromosome 1642, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD withour requiring keratinoplasty or keratectomy. The present sequence represents a consensus N-acetylglucosamine-6-sulforransferase which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ThrThrLeuSerGlnGlySerAlaAlaThrLeuHisMetAlaValArgAspLeu***Arg

                                                                               ద
                                                                                                                               ò
                                                                                                                                                                         The present sequence is human glycosyl sulfotransferase-4alpha (GST-4 alpha). GST-4 gene is found on chromosome 16q23.1 GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphated action of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus colorin, requested propositis, dermatcoid arthritis, polyarteritis nodesa, polymyositis, dermatcoid arthritis, polyarteritis nodes, glomerulonephritis, myasthemia gravis, Sogrem's Syndrome, Hashimoto's disease, darenalitis, Ngoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative collitis, dermatitis, myocarditis, regional enceritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronnental asthma, hypersensitivity, rheumatcic fever and tissue rejection during transplantation. Note: The present sequence is also shown in sequence listing (page no: 56) but lacks four nucleotides at its 3' end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              116
